INTRODUCTION

This transportation study presents the results of a transportation assessment for the proposed development of the Millbrae Moxy Hotel (proposed project or project), including a project description, project trip generation, intersection analysis, assessment of other modes, parking analysis, and recommended improvement measures. The recommendations included in this study are to inform decision makers of the transportation-related aspects of the project.

The analysis was conducted following City of Millbrae guidelines to identify effects of the project on the surrounding roadway system. Based on this assessment, the project is estimated to generate approximately 70 to 90 vehicle trips during the peak hours of the surrounding roadway system. This small amount of traffic is not expected to materially affect intersection operations. Additional improvement measures are recommended to further reduce the project trip generation and parking demand on site.

PROJECT DESCRIPTION

The proposed Moxy Hotel (project) will be located at 401 East Millbrae Avenue, adjacent to US 101 and near the San Francisco International Airport (SFO) in the City of Millbrae, California. The site currently contains two hotels, the Aloft San Francisco Airport and the Westin San Francisco Airport, on two parcels that total approximately 618,000 square feet (341,881 square feet for the Aloft site and 276,119 square feet for the Westin site). The two existing hotels include 668 rooms combined, with construction underway to increase the total number of rooms to 719. The existing construction is not included in this analysis since it has already been approved by the City and is assumed as part of the near-term baseline scenario. The project proposes to construct a new six-story, 71,649 square-foot hotel containing 209 guest rooms on an underutilized portion of the Aloft property. The proposed project would not construct additional parking. Instead, the hotel will utilize existing parking spaces at the Aloft and Westin hotels.

Table 1 summarizes the existing and proposed uses at the project site. Figure 1 displays the project study area.

Study Area

METHODOLOGY

DATA COLLECTION

Fehr & Peers collected 7-day, 24-hour roadway and driveway counts at the five locations listed below during October 2019 to determine the periods of peak traffic volumes near the project site and the traffic generated by the existing hotels on the project site.

1. Project Driveway at Old Bayshore Highway (north)
2. Project Driveway at Old Bayshore Highway (south)
3. Project Driveway at Millbrae Avenue
4. Millbrae Avenue near Old Bayshore Highway
5. Old Bayshore Highway near Millbrae Avenue

Following collection of the above roadway and driveway counts, we collected detailed intersection turning movement counts at four study intersections during the two-hour AM and PM peak periods on Thursday, November 7, 2019 based on the 7-day roadway tube counts. The intersection turning movement counts included vehicle, pedestrian, bicycle, and heavy vehicle counts. Intersection turning movement counts and 7-day roadway counts and peak period intersection turning movement counts are included in Appendix A. Local schools were in session and we did not observe any unusual traffic events during the time that the counts were collected. The four study intersections included:

1. Millbrae Avenue / Old Bayshore Highway / South McDonnell Road
2. Millbrae Avenue / US 101 NB Ramps
3. Millbrae Avenue / US 101 SB Ramps
4. Millbrae Avenue / Rollins Road

We also conducted a field visit during the peak periods to observe roadway operations and to verify existing lane configurations, intersection control devices, traffic signal timings, vehicle queues, and other roadway characteristics. During this field visit, we also observed circulation, parking, pedestrian, bicycle, truck loading, passenger loading, and transit conditions near the project site.

Lastly, this study uses parking occupancy data collected at the Westin and Aloft hotels from 2018 as part of *Parking Study for the Proposed Millbrae Moxy Hotel* (Fehr & Peers, 2019), which is contained in Appendix B.

LEVEL OF SERVICE

This study analyzes traffic operations using level of service (LOS) as the primary measure of performance. Motorized vehicle LOS is a qualitative measure of traffic flow from the perspective of motorists and is an indication of the comfort and convenience associated with driving. Typical factors that affect motorized vehicle LOS include speed, travel time, traffic interruptions, and freedom to maneuver. Empirical LOS criteria and methods of calculation are documented in the Highway Capacity Manual (HCM) published by the Transportation Research Board of the National Academies of Science (Transportation Research Board, 2017). The HCM defines six levels of service ranging from LOS A (representing free-flow vehicular traffic conditions with little to no congestion) to LOS F (oversaturated conditions where traffic demand exceeds capacity resulting in long queues and delays). The LOS definitions and calculations contained in the HCM are the prevailing measurement standard used throughout the United States and are used in this study. Table 2 summarizes intersection LOS criteria for signalized intersections.

TABLE 2: SIGNALIZED INTERSECTION LOS CRITERIA		
Level of Service	Description	Delay in Seconds
A	Progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.	< 10.0
B	Progression is good, cycle lengths are short, or both. More vehicles stop than with LOS A, causing higher levels of average delay.	> 10.0 to 20.0
C	Higher congestion may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level, though many still pass through the intersection without stopping.	> 20.0 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.	> 35.0 to 55.0
E	This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.	> 55.0 to 80.0
F	This level is considered unacceptable with oversaturation, which is when arrival flow rates exceed the capacity of the intersection. This level may also occur at high V/C ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be contributing factors to such delay levels.	> 80.0

Source: *Highway Capacity Manual 6th Edition*, Transportation Research Board of the National Academies of Science, 2017.

Intersection operations were analyzed using SimTraffic, the simulation add-on to Trafficware's Synchro 9 software package. SimTraffic considers the effects of signal coordination, vehicle queue spillbacks between intersections, and variation in driver and vehicle types. To ensure that the SimTraffic model accurately reflects operating conditions at the study intersections, the SimTraffic model was calibrated to the observed peak hour turn movement volumes and queue lengths using model inputs related to driver behavior.

SIGNIFICANCE CRITERIA

The City of Millbrae has specific significance criteria outlined in their General Plan to measure a project's impact on the environment. The impact criteria listed in this section are specific to transportation impacts. For this study, we have used the significance criteria not to identify significant impacts, but rather to assess the overall effect of the project on the transportation network in a way that is convenient and familiar to Millbrae's decision makers.

Intersection Operations

The City of Millbrae General Plan policies establish LOS D as the minimum acceptable threshold for signalized and unsignalized intersections. The minimum LOS D operating standard is also consistent with other jurisdictions in San Mateo County. Based on this policy, the project's effect on intersection operations would be considered unacceptable if the project would:

- Cause an intersection operating acceptably (LOS D or better) without the project to operate at LOS E or F;
- Increase the average delay at a signalized intersection operating at an unacceptable level (LOS E or F) by five or more seconds;

Parking Requirements

The City of Millbrae's Zoning Ordinance Code 10.05.2100 stipulates that hotel uses are required to provide one parking space for every guest room.

Transit, Bicycle, and Pedestrian Facilities

The project's effect on transit, pedestrian, or bicycle facilities would be considered unacceptable if the project would:

- Conflict with any existing or approved pedestrian, transit, and/or bicycle facilities or services;
- Cause the transit ridership demand to increase to levels greater than available capacity;
- Reduce access to transit service or create unsafe access for transit passengers;

- Cause pedestrian, transit, and/or bicycle facilities to be frequently blocked by cars or other potential safety obstructions/hazards;
- Cause vehicles to cross pedestrian or bicycle facilities on a regular basis at driveway entrances lacking adequate sight distance or warning systems;
- Encourage pedestrians to cross roads in undesignated areas.

EXISTING TRANSPORTATION CONDITIONS

This section provides a description of the existing multi-modal transportation system.

ROADWAY FACILITIES

US Highway 101 (US 101) is an eight-lane freeway located adjacent to the project site. US 101 connects San Francisco with the Peninsula and the South Bay to the south and with the North Bay to the north via the Golden Gate Bridge. US 101 connects to I-280 north of Millbrae via I-380. Access to US 101 is provided by on and off ramps along Millbrae Avenue very near the project site.

El Camino Real (State Route 82) is a major north-south arterial located approximately one half mile west of the project site that extends from San Francisco to the north to San Jose to the south, providing alternative regional access to the project site. El Camino Real has six lanes, a median that provides left-turn bays at most intersections, and on-street parking through Millbrae near the project site.

Millbrae Avenue is a major east-west arterial that extends from Bayshore Highway to El Camino Real. West of El Camino Real, Millbrae Avenue is a local street until its terminus near Vallejo Drive and I-280. Millbrae Avenue connects residential areas west of Millbrae to El Camino Real and US 101. Millbrae Avenue crosses over and provides a regional connection to US 101 at an interchange adjacent to the project site. Millbrae Avenue varies in width, with four lanes and a median that provides left-turn pockets at major intersections near the project site. Millbrae Avenue provides the main access driveway for the project which allows right- and left-turn access in to the project site but right-turn out access only.

Old Bayshore Highway is a north-south arterial that extends from Millbrae Avenue adjacent to the project site to the Broadway interchange with US 101 to the south. Near the project site, Old Bayshore Highway has four lanes with a median for left-turn bays at intersections and key driveways. Old Bayshore Highway provides one major access driveway for the project site and two minor access points.

South McDonnell Road is a frontage road running parallel to US 101 from the intersection of Old Bayshore Highway and Millbrae Avenue adjacent to the project site to the San Francisco International Airport (SFO). South McDonnell Road provides direct access to several SFO parking lots and Transportation Network Company (TNC) (e.g. Uber/Lyft) staging lots. South McDonnell Road is generally two lanes with left-turn bays for major driveways.

Rollins Road is a north-south arterial that extends south from the station to Broadway in Burlingame, providing connections to US 101 and El Camino Real via Millbrae Avenue and Broadway for commercial land uses along the corridor. Near the station, Rollins Road has four lanes with on-street parking.

EXISTING SITE ACCESS AND CIRCULATION

The two existing hotels on the project site are currently served by two major driveways and two minor driveways. The major driveway on Millbrae Avenue is located approximately 250 feet west of the intersection with Old Bayshore Highway and serves as the major access point for the Aloft Hotel. The driveway is side-street stop-controlled where driveway traffic must yield to Millbrae Avenue through traffic. The Millbrae driveway has a turn pocket serving westbound left-turning vehicles entering the project site. Currently, vehicles leaving the site are restricted to making a right turn only. Vehicles destined for US 101 must then make a U-turn at the Old Bayshore intersection. The major driveway on Old Bayshore Highway is located approximately 400 feet south of the intersection with Millbrae Avenue and serves as the major access point for the Westin Hotel. The driveway is signalized with an actuated pedestrian phase to cross Old Bayshore Highway. Two minor driveways are located on Old Bayshore Highway further south from the main Bayshore driveway. They are limited to right-in right-out movements only and do not provide direct access to the front of either hotel. All driveways connect to a shared parking area for both hotels. Passenger loading was observed to occur in front of each hotel at the designated loading zones near the lobbies.

INTERSECTION OPERATIONS

Figure 2 displays the existing AM and PM peak hour traffic volumes, lane configurations, and traffic controls at the four study intersections. Table 3 displays the existing AM and PM peak hour delay and LOS at the four study intersections (refer to Appendix C for detailed calculations).

TABLE 3: INTERSECTION LOS – EXISTING CONDITIONS					
Intersection	Traffic Control	AM Peak Hour		PM Peak Hour	
		Delay	LOS	Delay	LOS
1. Millbrae Avenue / Old Bayshore Highway / South McDonnell Road	Signal	15	B	29	C
2. Millbrae Avenue / US 101 NB Ramps	Signal	15	B	17	B
3. Millbrae Avenue / US 101 SB Ramps	Signal	25	C	25	C
4. Millbrae Avenue / Rollins Road	Signal	42	D	38	D

TABLE 3: INTERSECTION LOS – EXISTING CONDITIONS

Source: Fehr & Peers, 2019.

Notes:

1. For signalized intersections, delay (sec/veh) and LOS is reported for the overall intersection.
-

As seen in Table 3, all intersections currently operate acceptably at LOS D or better during the AM and PM peak hours. As noted during field observations and confirmed in the analysis simulation, there was some vehicle queuing that occurred during the peak hours at Rollins Road and at the freeway off-ramps, however most queues cleared each cycle and did not cause significant upstream bottlenecks. Freeway off-ramp queues did not extend past the gore points.

PARKING

The project would be constructed within an existing parking lot that is shared by the Aloft and Westin hotels. The existing parking supply of the shared lot is 893 spaces.

The existing parking demand is documented in *Parking Study for the Proposed Millbrae Moxy Hotel* (Fehr & Peers, 2019), which is contained in Appendix B. As part of this study, parking occupancy data collected on Wednesday, June 6, 2018 found that guest vehicles occupied 545 spaces out of a total 893 parking spaces available. Additionally, Westin employees used 10 spaces and Aloft employees used four spaces. During this period, 640 of the 668 total hotel rooms were occupied, which equates to a room occupancy rate of 96 percent. This represents a guest parking demand rate of 0.85 spaces per occupied room, suggesting that while demand for rooms is high at the existing hotels, not every room utilizes a parking space. As noted above, the two existing hotels are in the process of expanding from 668 to 719 total rooms. Based on parking demand data collected in 2018, the expected on-site hotel guest parking demand for the two existing hotels with 100 percent hotel room occupancy at 719 rooms would be 611 spaces. This parking demand rate was also compared to parking occupancy data at other Moxy hotels provided by Starwood Capital Group. The data suggested that a 0.85 demand rate calculated from the 2018 data yields a conservative parking demand that is more representative of the peak demand rather than typical demand.

Since the parking spaces are not fully occupied, the hotels provide their surplus spaces for other uses. At both the Aloft and the Westin, Park 'N Fly shuttle customers may park in surplus spaces and leave their vehicles at the hotel as a form of long-term airport parking. Additionally, the Aloft sometimes leases additional unused spaces to a rental car company. The number of rental car spaces may fluctuate in the future depending on the lease terms Aloft sets with a rental car company. If parking demand for hotel guests were to increase, the hotels would scale back or eliminate the other uses for on-site spaces.

The existing parking supply of 893 spaces for the two hotels (668 guest rooms; 719 guest rooms with additions) meets the City of Millbrae's zoning requirements of one parking space for every guest room.

PEDESTRIAN FACILITIES

Direct pedestrian access to the project site is provided by Old Bayshore Highway and Millbrae Avenue; however, these busy roadways can be intimidating for pedestrians due to the narrow and poorly maintained sidewalks, lack of buffer from the fast-moving traffic, and the large crossing distances at intersections spaced far apart. The speed limit along Millbrae Avenue is 35 miles per hour in the study area, but field observations indicate that traffic coming from or heading to US 101 frequently exceeds the posted speed

limit. Some pedestrians with limited mobility may have trouble fully crossing nearby intersections within the designated green time and intersections lack median refuges for pedestrians to safely wait.

Bayfront Park includes walking pathways and the Bay Trail and is accessible to pedestrians by crossing at one of the signalized intersections on Old Bayshore Highway. Old Bayshore Highway and the Bay Trail provide direct pedestrian access to some retail and restaurant uses within one mile of the project site.

In addition to Old Bayshore Highway and Millbrae Avenue, US 101 serves as a barrier to convenient and comfortable pedestrian access between the project site and destinations to the west of US 101 such as retail, restaurants, and the Millbrae Multimodal Transit Station (Millbrae Station).

BICYCLING FACILITIES

Millbrae's temperate climate and flat terrain is conducive for bicycling. However, the lack of continuous bicycle facilities and the heavily trafficked auto-oriented streets in the project vicinity make bicycling challenging and uncomfortable, even for the most confident riders. Busy roadways that dominate the area, such as Millbrae Avenue, Rollins Road, and US 101, create significant barriers to bicycling.

Bikeway planning and design in the City of Millbrae generally relies on the guidelines and design standards established by Caltrans as documented in "Chapter 1000: Bikeway Planning and Design" of the Highway Design Manual (5th Edition, California Department of Transportation, January 2001). These standards provide for three (3) distinct types of bikeway facilities, which are described below.

- **Multi-Use Path (Class I)** are a completely separate right-of-way designated for the exclusive use of bicyclists and pedestrians with minimal vehicle and pedestrian cross-flow. Class I paths are for non-motorized use only.
- **Bike Lanes (Class II)** are a portion of roadway designated by striping, signage, and pavement markings for the preferential or exclusive use of bicyclists. Bike lanes are generally appropriate for major arterials and collector roadways. They are generally at least five (5) feet wide.
- **Bike Routes (Class III)** are streets designated for shared use with pedestrians or motor vehicles by signs or pavement markings. Shared lanes are appropriate for roads with low speeds and traffic volumes. They can also be used for short stretches along Class II bikeways where there is insufficient right of way for a separated bicycle lane.

Figure 3 provides a map of existing and proposed bicycle facilities in the immediate vicinity of the project.

The project is situated close to the Bay Trail, which runs along the Bay coastline and provides regional bicycle access. This paved, multiuse trail is located east of Old Bayshore Highway and is 10- to 12-foot wide, with two (2) feet of additional clear shoulder width on both sides and 14- to 16-foot clearance to the nearest

roadway. The Bay Trail ends at Millbrae Avenue and continues north as Class II bike lanes on South McDonnell Road. In addition to the Bay Trail, Old Bayshore Highway is designated as a Class III bike route.

Other than these two facilities, there is minimal bicycle infrastructure within the vicinity of the project. There are no designated bicycle facilities that connect the project site with areas west of US 101, including Millbrae Station. To access these areas, bicyclists must ride in the wide curb travel lanes with fast-moving cars.

Bicycle parking is also limited in the study area. Some short-term bicycle parking facilities are located at the front of the existing Westin hotel. Additionally, Millbrae Station has a mix of short and long-term bicycle parking facilities, however most of these facilities are located at the west entrance and appear to be largely unused. The east entrance has one bicycle rack for short-term parking. It is unclear from the proposed project's design plans if bicycle parking will be provided for guests or employees.

TRANSIT FACILITIES

The project study area is served by three major transit providers: BART, Caltrain, and the San Mateo County Transit District (SamTrans). BART provides regional rail service, Caltrain provides commuter rail service along the peninsula, and SamTrans provides local and regional bus service. Transit service (bus routes, major bus stops and the BART and Caltrain station) is shown on Figure 4.

SamTrans provides direct bus service to the project site via two local routes: Route 397 and Route 292. Route 292 is a north-south bus line that provides express regional transit service between Downtown San Francisco, Hillsdale, and the San Francisco International Airport. The route operates with 15-minute headways during peak periods. The route stops on Old Bayshore Highway a quarter mile southeast of the project site. Route 397 is a north-south bus line that provides express, late night regional transit service between Downtown San Francisco and Palo Alto primarily via El Camino Real. The route operates every night from 1:00 AM to 6:00 AM with one-hour headways. The route stops at the Millbrae Station. There is also a northbound stop located at the intersection of El Camino Real and Murchison Drive.

Millbrae Station is approximately a half mile west of the project site and is the only station providing direct intermodal connection between BART and Caltrain. Millbrae Station is the southern terminus of the BART Richmond-Millbrae Line and the SFO Airport-Millbrae-Antioch Line and provides fast and frequent service to many parts of the Bay Area, including downtown San Francisco, downtown Oakland, and the San Francisco International Airport. BART provides service via Millbrae Station from 4:00 AM to 12:00 AM on weekdays with typical headways (frequency of service) of 15 minutes during peak and mid-day hours. Caltrain provides service via Millbrae Station from 5:15 AM to 12:00 AM on weekdays with eight limited and Baby Bullet trains in the AM peak and one local, seven limited, and six Baby Bullet trains in the PM peak.

PROJECT TRAVEL DEMAND

This section analyzes the project's trip generation and distribution characteristics, as well as the project's parking generation.

TRIP GENERATION

This section analyzes the trip generation of the existing hotel uses and develops trip rates for the proposed project.

Existing Hotel Trip Generation

The existing trip generation rates of the Westin and Aloft hotels were calculated using the traffic data collected in October 2019 at the following project driveways:

- Project Driveway at Old Bayshore Highway (north)
- Project Driveway at Old Bayshore Highway (south)
- Project Driveway at Millbrae Avenue

For purposes of the trip generation analysis, this study uses the existing hotel uses presented in Table 1 to estimate the site's existing weekday AM and PM peak hour trip generation rates during the peak hours of adjacent street traffic. Table 4 presents the existing trip rate and trip generation for the site.

TABLE 4: EXISTING HOTEL TRIP GENERATION							
Time Period	Hotel Rooms	Observed Traffic Volume			Observed Trip Generation Rate		
		Total	In	Out	Total	In	Out
AM Peak Hour (7:45-8:45)	719	297	146	151	0.41	49%	51%
PM Peak Hour (4:15-5:15)		253	113	140	0.35	45%	55%

Source: Fehr & Peers, 2019.

Notes:

1. Based on traffic counts collected in October 2019.
2. Trip generation rate = (observed traffic count) / (hotel rooms)

Calculated Project Trip Generation

Trip generation for new projects is typically calculated using the ITE *Trip Generation Manual*, 2017. ITE rates are based on national averages for similar land use types. However, ITE recommends using locally collected

trip generation data when available rather than using generic national averages included in the manual. Thus, the Project's trip generation is calculated using rates based on the existing hotels on the project site. Because the trip rate is derived from existing driveway counts, it accounts for all vehicle trips entering and exiting the site, including any trips made by TNCs, which typically generate both an inbound and outbound trip per visit. The existing driveway counts include any vehicle trips associated with the Park 'N Fly use that currently operate at the site. Although Park 'N Fly may not continue to operate after the proposed project is built, trips associated with this use were not removed, resulting in a more conservative analysis. Table 5 presents the AM and PM peak hour trip generation of the proposed project. The proposed project would generate 86 new AM peak hour trips and 73 new PM peak hour trips, which corresponds to an approximate 29 percent increase in overall trip generation of the site.

TABLE 5: PROJECT TRIP GENERATION ESTIMATE

Land Use	Trip Rates				Trips			
	AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
	Total	In / Out	Total	In / Out	Total	In / Out	Total	In / Out
Moxy Hotel (209 rooms)	0.41	49% / 51%	0.35	45% / 55%	86	42 / 44	73	33 / 41

Source: Fehr & Peers, 2019.

Notes:

1. Based on traffic counts collected in October 2019.
2. Trip generation rate = (observed traffic count) / (hotel rooms)

TRIP DISTRIBUTION AND ASSIGNMENT

Figure 5 displays the distribution of project-generated trips. These percentages are based on the project's expected travel characteristics and the existing turning movement volumes for trip patterns to and from the project site. A large percentage of project trips are expected to be coming to/from SFO and may access the airport either via US 101 or South McDonnell Road. Some trips are also expected to use US 101 to travel to/from other origins/destinations along the Peninsula. A small percentage of trips are expected to use El Camino Real to travel regionally, and some trips are expected to use Rollins Road to access the BART/Caltrain station. Since the Millbrae Avenue driveway provides more direct access to the project, a greater proportion of project trips are expected to use the Millbrae Avenue driveway than the Old Bayshore Highway driveways. Project vehicle trips presented in Table 5 were assigned to the roadway network based on the trip distribution shown on Figure 5. Project-generated vehicle trips were assigned to specific turning movements at the four study intersections and are presented in Figure 6.

PARKING DEMAND

The proposed project would not construct additional parking. Instead, the hotel would utilize existing parking spaces at the Aloft and Westin hotels while removing ten spaces to accommodate the building footprint. The total parking supply for the three hotels would therefore be reduced from 893 spaces to 883 spaces. As noted above, City code requirements only apply to the total number of hotel rooms; however, employee parking is accounted for in determining parking demand at the site.

Assuming Moxy Hotel guests park at a rate of 0.85 spaces per occupied room and that five additional spaces would be used for employee parking, then full hotel room occupancy would yield a parking demand of 789 spaces. The parking supply would be 864 spaces (883 spaces minus – 19 employee spaces), resulting in a surplus of 75 parking spaces. For more detail, refer to Appendix B.

The assumption that the project will generate parking demand at the same rate as the existing Aloft and Westin Hotels is conservative since the project markets heavily towards younger travelers who are more likely to arrive at the hotels by non-driving modes. Moxy Hotels offer modestly sized rooms that are more comfortable for solo travelers or couples as opposed to families or larger groups. The proposed project averages 200 square feet per room, while the existing Millbrae Aloft and Westin average 265 square feet and 320 square feet per room, respectively. Further, the Denver Moxy hotel parking survey showed a much lower parking rate per room compared to the existing Aloft and Westin hotels, as further explained in Appendix B.

Figure 6

PROJECT EFFECTS & IMPROVEMENT MEASURES

PROJECT EFFECTS ON SITE ACCESS AND CIRCULATION

Access to the project site will remain largely unchanged with the addition of the proposed project; the site will continue to be served by two major driveways and two minor driveways. As mentioned previously, the major driveway on Millbrae Avenue is expected to carry the majority of project trips since it has more direct access to the project's main lobby. Vehicles using the Millbrae driveway will continue to have to make a right turn out of the driveway then a U-turn at the Old Bayshore intersection to access the US 101 ramps. All parking on the project site will continue to be shared between the three hotels. Passenger loading is expected to continue to occur in front of each hotel's lobby at the designated loading zones. The proposed project does not propose to drastically alter the overall circulation patterns at the project site and the existing circulation is expected to be adequate to handle the additional vehicle and passenger loading demand.

PROJECT EFFECTS ON INTERSECTION OPERATIONS

This section describes the project's effects on existing and future (2040) intersection operations.

Existing Plus Project Conditions

Figure 7 displays the AM and PM peak hour traffic volumes, lane configurations, and traffic controls at the four study intersections under Existing Plus Project conditions. Table 6 displays AM and PM peak hour delay and LOS at the four study intersections under Existing Plus Project conditions (refer to Appendix C for detailed calculations).

TABLE 6: INTERSECTION LOS – EXISTING PLUS PROJECT CONDITIONS

Source: Fehr & Peers, 2019.

Notes:

1. For signalized intersections, delay (sec/veh) and LOS is reported for the overall intersection.
2. The average delay decreases at intersection 4 during the AM peak hour with the addition of project traffic. Although counterintuitive, this can be expected when project trips are added to movements that are operating with low delay and thus decrease the overall average delay at the intersection.

As seen in Table 6, all study intersections would continue to operate acceptably at LOS D or better under existing plus project conditions. Based on the simulation results, vehicle queuing at the study intersections did not appear to significantly worsen with the addition of project trips. Most queues were still able to clear in one cycle length and freeway off-ramp queues still did not extend past the gore points.

Existing Plus Project Conditions

Peak Hour Intersection Turn Movement Volumes

2040 Plus Project Conditions

Cumulative (2040) volume forecasts were developed based on outputs from the travel demand model developed by the Santa Clara Valley Transportation Authority and the San Mateo City/County Association of Governments (VTA C/CAG model). The model was originally developed for the Caltrain Electrification EIR and later modified for the California High Speed Rail analysis. For this cumulative scenario, forecasts were further refined to account for the Millbrae Station Area Specific Plan and updated existing volumes at study intersections. The 2040 intersection operations analysis assumes Association of Bay Area Governments (ABAG) land use projections and reasonably foreseeable transportation network improvements. These improvements include minor signal timings modifications at the study intersections to reflect changes in future volumes, as well as widening of Millbrae Avenue between Rollins Road and the US 101 SB ramps as identified in the *San Mateo Countywide Transportation Plan 2040*¹.

Figure 8 and Figure 9 display the AM and PM peak hour traffic volumes, lane configurations, and traffic controls at the four study intersections under 2040 No Project and 2040 Plus Project conditions, respectively. Table 7 displays AM and PM peak hour delay and LOS at the four study intersections under 2040 no project and 2040 plus project conditions (refer to Appendix C for detailed calculations).

Notes:

1. For signalized intersections, delay (sec/veh) and LOS is reported for the overall intersection.
2. Bold text indicates unacceptable operations.

¹ San Mateo Countywide Transportation Plan 2040: <http://52.43.20.201/wp-content/uploads/2014/05/SMCTP-2040-FINAL.pdf>

As seen in Table 7, all study intersections except for the Millbrae Avenue/Rollins Road intersection operate at acceptable LOS D or better under 2040 No Project and 2040 Plus Project conditions. The Millbrae Avenue/Rollins Road intersection would operate at unacceptable LOS E under 2040 no project conditions and would continue to operate at unacceptable LOS E under 2040 plus project conditions. However, intersection delay would not increase by more than five seconds, and therefore the project's contribution to intersection delay would not be considerable. Under 2040 conditions, vehicle queuing throughout the study area gets slightly worse compared to existing conditions due to increased demand volumes and limited pocket lengths. Most queues, however, continue to clear each cycle and do not block adjacent intersections. The US 101 SB off-ramp queue worsens under 2040 conditions but still does not extend past the gore point. Vehicle queuing under 2040 Plus Project conditions did not appear to significantly worsen with the addition of project trips.

PROJECT EFFECTS ON ALTERNATIVE MODES OF TRAVEL

Given the project's land use context, the majority of project-generated trips would be made by automobile, and travel by alternative modes would represent a small proportion of the project's overall trip generation.

The project would add vehicle trips to the study area, but would not substantially alter existing pedestrian, bicycle or transit access. The project driveways are expected to adequately handle the additional vehicle trips generated by the proposed project. The project would not create any new conflicts with any existing or approved pedestrian, transit, and/or bicycle facilities or services. Project-generated walking or biking trips would be minimal and would be encouraged to cross roads at designated areas to access the existing and approved pedestrian or bicycling facilities, including the Bay Trail east of Old Bayshore Highway. The project would provide adequate driveway access such that it would not cause pedestrian, transit, and/or bicycle facilities to be frequently blocked by cars or other potential safety obstructions/hazards. Based on the project location, accessibility of transit, demographics of hotel guests, and size of the project, it is expected that relatively few people would use transit to access the site. The project would not cause the transit ridership demand to increase to levels greater than available capacity, nor would it reduce access to transit service or create unsafe access for transit passengers.

RECOMMENDED IMPROVEMENT MEASURES

Signal Timing Optimization

A majority of the project trips are expected to use the existing Millbrae Avenue driveway since it provides a more direct connection to the project within the hotel site. As a result, a high proportion of outbound project trips would utilize the eastbound u-turn and left turn lanes at the Millbrae Avenue/Old Bayshore Highway intersection to travel to the SFO Airport, the Millbrae Station, or US 101. Although our analysis concludes that the intersection would continue to operate acceptably with the project trips, intersection operations could be improved with minor signal timing optimization.

Transportation Demand Management (TDM)

The following strategies can be implemented to reduce the number of vehicle trips generated by the project and/or the parking demand at the project site.

Transportation Network Company Partnership

By partnering with a Transportation Network Company (TNC) provider (e.g. Lyft or Uber), the hotels could offer discount codes for guests to use on their rides. TNC trips that start or end at an SFO terminal incur a

surcharge of \$5. For hotel guests arriving from the airport, a TNC discount would help provide both an efficient and cost-effective manner of accessing their hotel without needing to rent a vehicle or needing to park a vehicle on site.

Airport/BART Shuttle Service

Driving is often the preferred option for travelers who are averse to relying on a service that is unpredictable. Making hotel shuttle service to/from SFO and Bay Area Rapid Transit (BART) very frequent and advertising ease of use would help hotel guests understand that utilizing the shuttle may be a preferable option over renting a vehicle. In addition, the hotel shuttle can be promoted as an easy way to connect with BART train service into San Francisco. BART provides hotel guests with a transit option for accessing destinations in San Francisco and the greater Bay Area without needing to drive themselves.

Demand-Based Parking Pricing

Consumers are price-sensitive and often make decisions by evaluating the cost of various options. If parking a vehicle presents a large expense, then more price-sensitive travelers consider alternative mode options. Since the supply of parking at the hotels would be fixed, one way to ensure that the parking spaces will be available is to increase the price during high-demand times. If the hotel anticipates high parking demand based on higher than average room reservations or knowledge that a conference will be occurring nearby, the daily rate for parking could be increased from the current \$30/day charge and then communicated to guests with reservations. By communicating the increased rate in advance, guests will have an opportunity to make informed decisions about their options for accessing the hotel.

In addition, room discounts could be offered for guests who do not drive and park a vehicle during their stay.

Marketing Campaign

The project can signal to patrons that driving to the hotel is not the only transportation option by providing informational materials on other modes. These materials can be disseminated over social media platforms to reach potential guests and help establish a brand identity as a hotel that most guests do not access by driving.

Preferential Parking for Vanpools or Carpools

The project can reserve convenient parking spaces for high-occupancy vehicles (HOVs) to encourage ridesharing. Preferential spaces could be striped and signed at a low cost. By implementing this strategy, there will be minimal enforcement costs. Complementary strategies such as a Guaranteed Ride Home program and a ridematching program will further encourage ridesharing.

Transportation System Management (TSM) Program Compliance

The project would participate in mitigating traffic problems by implementing TSM measures and encourage alternatives to travel by single-occupant vehicles that would reduce the number of automobile trips. As a result, the project would be in compliance with the goals and objectives identified in the City of Millbrae Municipal Code Chapter 4.85 Transportation System Management (TSM) Program.

CONCLUSION

The project as proposed will construct a new 209 room Moxy hotel on the existing site shared with two existing hotels – the Westin and the Aloft – near the SFO airport. Fehr & Peers collected 7-day roadway tube counts to determine the peak periods of traffic on the surrounding roadways and determined that the weekday AM (7-9 AM) and PM (4-6 PM) peak periods saw the most congestion under existing conditions. Fehr & Peers also collected driveway tube counts at the existing hotel driveways to derive trip generation rates for the proposed hotel. The project generated trips were then distributed to the roadway network and assigned to specific turning movements at study intersections to measure the change in intersection delay and LOS compared to without project conditions. The analysis found that the addition of project trips did not materially worsen intersection operations or vehicle queueing in the study area. Project added trips are also not expected to conflict with any pedestrian, bicycle, transit or other modes of transportation in the study area. The site driveways are expected to operate similarly to under existing conditions and are expected to handle the addition of project vehicle trips. Some improvement measures are recommended to further reduce the project's vehicle trip generation and parking demand, including signal timing optimization, and various TDM measures such as TNC partnerships, airport/BART shuttles, demand-based parking pricing, a marketing campaign, and preferred parking for vanpools and carpools.

**APPENDIX B: *PARKING STUDY FOR THE PROPOSED MILLBRAE MOXY
HOTEL* (FEHR & PEERS, 2019)**

MEMORANDUM

Date: May 23, 2019
To: Kevin Tazalla, Starwood Capital Group
From: Mike Hawkins, PE and Krystian Boreyko, Fehr & Peers
Subject: **Parking Study for the Proposed Millbrae Moxy Hotel**

SF19-1032

The following technical memorandum presents the results of an analysis that was performed to assess the parking demand and availability for a proposed Moxy Hotel (the project) located in Millbrae, California. The project site currently contains two hotels – the Aloft San Francisco Airport and the Westin San Francisco Airport – and a shared surface parking lot that serves both hotels. The proposed project would add a third hotel to the site and would not increase the parking supply.

The analysis included a review of the existing parking supply and a comparison of parking demand data collected at the two hotels and an existing Moxy Hotel in Denver, Colorado. The parking demand data were used to develop a parking generation rate to estimate the parking demand for the project. The results were used to assess whether the parking supply could accommodate the added demand generated by the project. This technical memorandum also presents strategies to manage the parking demand at the project site, if needed.

After analyzing the parking demand at three hotels, including an existing Moxy Hotel, and assessing different parking demand scenarios for the proposed Moxy Hotel, it was determined that the existing parking supply at the project site is sufficient to meet the parking demand with the new hotel.

Existing Hotel Uses on Project Site

The proposed Moxy Hotel will be located at 401 East Millbrae Avenue, adjacent to US-101 and near the San Francisco International Airport (SFO) in the City of Millbrae, California. The site currently contains two hotels, the Aloft San Francisco Airport and the Westin San Francisco Airport. The project site is made up of two parcels that total approximately 618,000 square feet (341,881 square

feet for the Aloft site and 276,119 square feet for the Westin site). **Table 1** shows the number of guest rooms at the existing hotels along with the existing parking supply.

Table 1: Existing Hotel Guest Rooms and Parking Supply

Hotel	Guest Rooms ¹	Parking Supply (spaces) ²
Westin	397	402
Aloft	271	491
TOTAL	668	893

Source: Starwood Capital Group, 2019

Notes:

1. Renovations currently under construction will increase the total number of rooms at the Westin and the Aloft to 421 and 298, respectively
2. Total parking supply is shared between the two existing hotels

The City of Millbrae's Zoning Ordinance Code 10.05.2100 stipulates that hotel uses are required to provide one parking space for every guest room. The combined parking supply of the two hotels is 893 parking spaces for 668 guest rooms (719 guest rooms with pending additions), which meets Millbrae Zoning requirements. All parking is shared by the two hotels. Of the 893 available spaces, approximately 10 spaces are used by Westin employees and four spaces are used by Aloft employees, based on observations.

Since the parking spaces are not fully occupied, the hotels provide their surplus spaces for other uses. At both the Aloft and the Westin, Park 'N Fly shuttle customers may park in surplus spaces and leave their vehicles at the hotel as a form of long-term airport parking. Additionally, the Aloft sometimes leases additional unused spaces to a rental car company. The number of rental car spaces may fluctuate in the future depending on the lease terms Aloft sets with a rental car company. If parking demand for hotel guests were to increase, the hotels would scale back or eliminate the other uses for on-site spaces.

Proposed Project

The proposed Moxy Hotel includes 209 rooms over six stories and approximately 70,000 gross square feet.

The proposed Moxy Hotel would not include added parking. Instead, the hotel will utilize existing parking spaces at the Aloft and Westin hotels while removing ten spaces to accommodate the building footprint; the total parking supply for the three hotels would be 883 spaces. It is assumed an additional five spaces would be used for employee parking, for a total of 19 employee parking spaces. As noted above, City code requirements only apply to the total number of hotel rooms; however, employee parking is accounted for in determining parking demand at the site. Factoring employee parking, total parking supply available for hotel guests would be 864 spaces.

Parking Demand

The following section describes the demand for parking for the existing hotels on the project site and at a Moxy Hotel in Denver, Colorado. The Denver Moxy Hotel was surveyed to help inform the parking demand rate for the proposed Millbrae Moxy Hotel.

Existing Demand at the Aloft and Westin Hotels

Parking occupancy data was collected at the Westin and Aloft from 9:30 pm to 10:30 pm on Wednesday, June 6, 2018. Data collection occurred during the evening hour when most hotel guests with vehicles would be in their rooms. In addition, weeknight data was collected because hotel room occupancy rates are higher at this location on weeknights vs. weekends per trend data provided by Starwood Capital Group for the Aloft and Westin Hotels. **Table 2** shows the total parking supply and numbers of occupied spaces. On the survey day, 640 of the 668 total rooms were occupied, for a room occupancy rate of 96 percent. At the peak parking demand time, guest vehicles occupied 545 spaces (229 + 316). This represents a guest parking demand rate of 0.85 spaces per occupied room, suggesting that while demand is high at the existing hotels, not every room utilizes a parking space. To represent a conservative worst-case parking scenario, **Table 3** shows that the expected on-site hotel guest parking demand for the two existing hotels with 100 percent hotel room occupancy would be 568 spaces.

In addition to the June 6, 2018 data, Starwood Capital Group provided monthly aggregated parking data for 2018. Monthly occupancy rates for the combined parking facility at the Aloft and Westin Hotels range from an average of 56% to 63%. The average monthly demand rate suggests that demand for hotel parking was unusually high on June 6, 2018 and that using the 0.85 demand rate calculated from the June 6, 2018 data yields a conservative parking demand rate that is more representative of the peak demand rather than typical demand.

Table 2: Surveyed Parking Usage at Existing Hotels (96% Room Occupancy)

Westin - Parking Space Users	Parking Capacity	Occupied Spaces ¹	Available Spaces	Percent Occupied
Hotel Guests	366	229	137	63%
Park 'N Fly	26	26	0	100%
Employees	10	10	0	100%
Total	402	265	137	66%
Aloft - Parking Space Users				
Hotel Guests	357	316	41	89%
Park 'N Fly	95	95	0	100%
Employees	4	4	0	100%
Rental Car	35	35	0	100%
Total	491	450	41	92%
Total Capacity and Demand	893	715	178	79%

Source: ACE Parking Management, CHS Consulting Group, 2018

Notes:

1. Observed during June 2018 data collection

Table 3: Demand for Hotel Guest Parking with 100% Room Occupancy

Hotel	Parking Demand (Existing)	Hotel Guest Parking Demand Rate	Parking Demand (100% Room Occupancy)
Westin	229	0.85¹	338
Aloft	316		230
TOTAL	545		568

Source: Fehr & Peers, 2019

Notes:

1. The demand rate varies for each hotel but since parking supply is pooled, the average demand rate is applied to determine aggregate demand.

Existing Demand at Denver Moxy

The Moxy Hotel in Denver was surveyed to help understand the level of parking demand for Moxy Hotels' clientele. Aggregated weeknight and weekend room occupancy and parking data from the Denver Moxy from the most recent 12 months (March 2018 – March 2019) was used to inform the analysis. While the proposed site is near a large international airport, the Denver hotel site is located in a more suburban area where a higher rate of driving trips can be expected. The Moxy Hotel in Denver is otherwise comparable to the proposed Millbrae Moxy in design and concept.

As shown in **Tables 4 and 5** below, the average parking demand rate for guests is 0.14 spaces per occupied room on a weeknight and 0.41 spaces per occupied room on a weekend night. Both parking demand rates are much lower than the 0.85 rate observed at the existing Millbrae Aloft and Westin. While the Denver Moxy location has a higher parking demand on weekends, the Millbrae location is expected to have a higher demand on weekdays based on trends observed at the Aloft and Westin hotels.

Table 4: Denver Moxy Weeknight Parking Demand

Parking Space Users	Parking Capacity	Occupied Spaces	Available Spaces	Occupied Rooms	Guest Parking Demand Rate per Occupied Room
Hotel Guests	73	15	58	108	0.14
Employees	5	5	0	N/A	N/A
Total	78	20	58	108	0.14

Table 5: Denver Moxy Weekend Parking Demand

Parking Space Users	Parking Capacity	Occupied Spaces	Available Spaces	Occupied Rooms	Guest Parking Demand Rate per Occupied room
Hotel Guests	73	30	43	74	0.41
Employees	5	5	0	N/A	N/A
Total	78	35	43	74	0.41

Source: Starwood Capital Group, 2019

Demand for Proposed Project

The anticipated demand for hotel guest parking spaces for the project was conservatively assessed based on the observed parking rate at the existing hotels on the site, which is higher than the rates at the Moxy Hotel in Denver. Calculations account for the additional 24 Westin rooms and 27 Aloft rooms that are currently under construction. This analysis also conservatively considers parking demand if every room at all three hotels is occupied.

Assuming Moxy Hotel guests park at 0.85 spaces per occupied room and that 19 spaces are dedicated to hotel employees, then full hotel room occupancy would yield a parking demand of 789 spaces. The parking supply would be 864 spaces (883 – 19 employee spaces), resulting in a surplus of 75 parking spaces (**Table 6**).

Table 6: Parking Demand for Proposed Moxy Hotel

Hotel	Hotel Rooms	Parking Supply ¹	Guest Spaces Demand Rate	Occupied Spaces
Westin	421	864	0.85	358
Aloft	298			253
Moxy (max)	209			178
TOTAL	928	864		789
			Surplus Spaces:	75²

Source: Fehr & Peers, 2019

Notes:

1. Construction of the Project removes 10 existing parking spaces; Parking supply excludes 19 spaces for employee parking
2. Analysis assumes no rental car or Park 'N Fly usage

The assumption that the proposed Moxy Hotel will generate parking demand at the same rate as the existing Aloft and Westin Hotels is conservative given that Moxy Hotels market heavily towards younger travelers who are more likely to arrive at the hotels by non-driving modes. Moxy Hotels offer modestly sized rooms that are more comfortable for solo travelers or couples as opposed to families or larger groups. The proposed Moxy Hotel averages 200 square feet per room, while the existing Millbrae Aloft and Westin average 265 square feet and 320 square feet per room, respectively. Families or larger groups are more likely to travel by vehicle to a hotel since a multi-occupant vehicle can be easier and more cost effective compared to paying multiple transit fares or surcharges for larger taxi/rideshare vehicles.

Parking Management Strategies

Although the parking demand for the proposed Moxy Hotel is expected to be accommodated by the existing parking on-site supply, the following strategies can be put in place if parking demand at the Millbrae Moxy Hotel becomes higher than anticipated. The proposed strategies are designed to help reduce the amount of people accessing the hotel via personal vehicles, and thus reduce demand for parking.

Transportation Demand Management

Transportation Demand Management (TDM) programs can offer travelers options for making trips without driving and parking a vehicle. The following strategies could be implemented by the Moxy Hotel or by the three hotels jointly to help reduce the number of guests parking a vehicle.

Transportation Network Company Partnership

By partnering with a Transportation Network Company (TNC) provider (e.g. Lyft or Uber), the hotels could offer discount codes for guests to use on their rides. TNC trips that start or end at an SFO terminal incur a surcharge of \$5. For hotel guests arriving from the airport, a TNC discount would help provide both an efficient and cost-effective manner of accessing their hotel without needing to rent a vehicle and could also offset the TNC airport surcharge.

Airport/BART Shuttle Service

Driving is often the preferred option for travelers who are averse to relying on a service that is unpredictable. Making hotel shuttle service to/from SFO and Bay Area Rapid Transit (BART) very frequent and advertising ease of use would help hotel guests understand that utilizing the shuttle may be a preferable option over renting a vehicle. In addition, the hotel shuttle can be promoted as an easy way to connect with BART train service into San Francisco. BART provides hotel guests with a transit option for accessing destinations in San Francisco and the greater Bay Area without needing to drive themselves.

Demand-Based Parking Pricing

Consumers are price-sensitive and often make decisions by evaluating the cost of various options. If parking a vehicle presents a large expense, then more price-sensitive travelers consider alternative mode options. Since the supply of parking at the hotels would be fixed, one way to ensure that the

parking spaces will be available is to increase the price during high-demand times. If the hotel anticipates high parking demand based on higher than average room reservations or knowledge that a conference will be occurring nearby, the daily rate for parking could be increased from the current \$30/day charge and then communicated to guests with reservations. By communicating the increased rate in advance, guests will have an opportunity to make informed decisions about their options for accessing the hotel.

In addition, room discounts could be offered for guests who do not park a vehicle during their stay.

Marketing Campaign

The Moxy Hotel can signal to patrons that driving to the hotel is not the only transportation option by providing informational materials on other modes. These materials can be disseminated over social media platforms to reach potential guests and help establish a brand identity as a hotel that most guests do not access by driving.

Valet Parking Service

If demand for hotel guest parking is found to be consistently high, the hotels could begin to offer a valet parking service. Valet attendants would be able to store vehicles in a more space-efficient manner and increase parking supply by storing some vehicles in the parking aisles.

Limit Park 'N Fly Usage

The project site currently fills underutilized parking spaces with Park 'N Fly customers. If the parking demand for hotel guests increases, the number of spaces available to Park 'N Fly customers could be decreased. However, eliminating Park 'N Fly usage altogether would likely not be necessary.

Conclusion

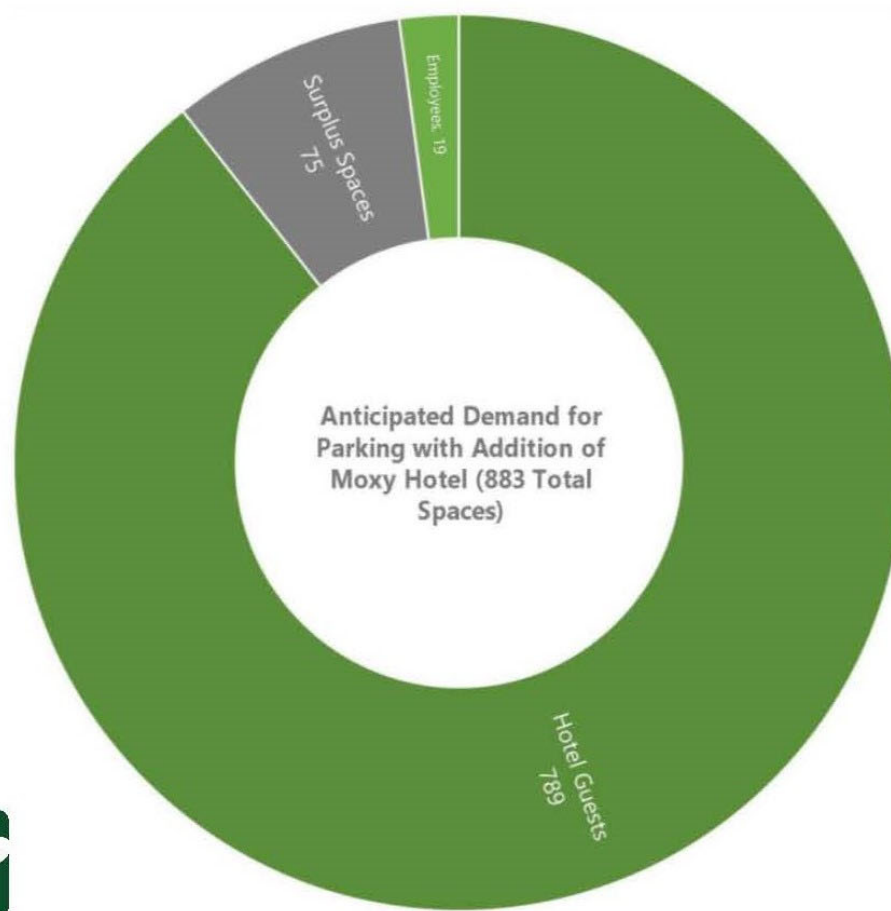

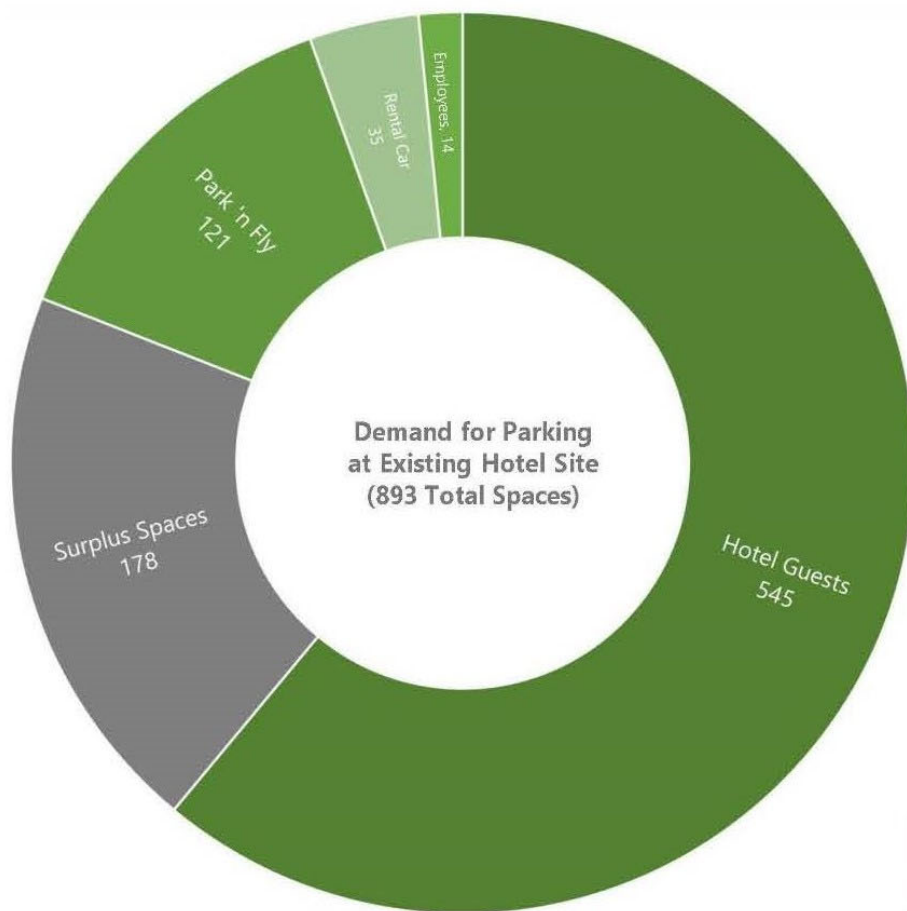

This technical memorandum presented the current parking demand at the proposed Millbrae Moxy Hotel site based on data collected at the existing Aloft and Westin Hotels. It has also calculated the expected parking demand for the entire site after the Moxy Hotel is built. Based on the conservative assumptions that all three hotels will be at 100 percent occupancy at the same time that the Moxy Hotel will generate parking demand at the same rate as the two existing more traditional hotels, and that the parking demand is based on the peak parking demand rather than the average demand, we found that the project site would have a sufficient supply of parking to accommodate

demand from the new hotel. The following illustration summarizes the change in parking demand anticipated from the Moxy Hotel. No added parking is needed at the project site.

If any of the three underlying assumptions prove to be overly conservative, an even larger surplus of available parking could result. If the parking demand is found to be higher than expected, the hotel(s) could put in place transportation demand management strategies like Uber/Lyft partnerships, improving airport/BART shuttle service, and putting in place dynamic pricing for parking according to demand levels.

Existing vs. Anticipated Parking Demand at Proposed Moxy Hotel Site
